[The IPCC's 'AR5': Those Stubborn Global Temperature Facts They Want The Public To Ignore](#)

This

chart (click on to enlarge) and the factual truth it represents about global warming and climate change is not one you'll see in the latest IPCC AR5 report summary.

The known "hiatus" in global warming over the last 15 years has been a major climate issue, discussed both inside and outside the scientific community.

Although the IPCC [promised to address](#) the "hiatus" in their new report, it chose not to.

The principal reason they did not address the temperature empirical evidence, as represented in this plot of the data, is that any rational and objective explanation completely undercuts the shaky foundations of the CO2-AGW hypothesis.

The plotted data clearly shows that the previous modern global warming has shrunk to an insignificant per century rate, and may continue to decrease over the near future. This occurs while the levels and growth of atmospheric CO2 continue a relentless climb.
